

Compliance audit tools

Name : LIU TIANYU

Matriculation ID : G2505697D

Email :TIANYU013@e.ntu.edu.sg

Why is this product right for
our company?

As a globally operating financial institution, we face the risk of differing regulatory rules across countries when expanding our lending business.

At the "decision-making level," it achieves localized compliance through a flexible jurisdictional rules engine, thus striking an optimal balance between "technology scaling" and "compliance localization." It also analyzes credit scores to explain the rationale to regulators and consumers.

What problem does this tool solve
that a memo or spreadsheet cannot?

memo or spreadsheet

Static compliance
records

Fixed, unable to provide
feedback for fine-tuning

No explanation

My tool

Measuring dynamic real risk

Dynamically calculate
compliance boundaries for
different quantiles

Detailed analysis of the
reasons for the operation

What regulatory divergence does it handle, and how?

Parameterization of Domain Rules

US:disparate_impact_ratio ≥ 0.80

EU:demographic_parity_difference ≤ 0.05

.....(can keep adding)

Using the same model output to enter different rule engines will result in different audit statuses. If more regions need to be adapted in the future, their specific rules only need to be input into JURISDICTION_CONFIG.

What does it not do — and why did you make that boundary choice?

To do : Audit, monitoring, and alerting.

Not to do: use auto-reweighing or automatically adjust model parameters to force compliance

Because "judgment cannot be outsourced." Fairness testing is a trade-off between business and ethics; blindly automating fixes could introduce reverse discrimination or significantly sacrifice the model's predictive accuracy, thus leading to greater credit default risk. We choose to leave the tool at the judgment stage, returning the final right and responsibility for correction to the official authorities.
